reference to several embodiments, it will be understood by those skilled in the art that various changes may be made and equivalents may be substituted for elements of the embodiments without departing from invention. For example, instead of using a removable memory card 24, the image data files 24a and enhancement files 24b could be stored in non-removable electrically programmable non-volatile memory located inside the camera. As shown in FIG. 11, image data would be downloaded from the non-volatile image memory 35 in the camera 1 to the computer 4 over a standard electrical computer interface cable 38, such as a RS-232 or SCSI interface connection. The enhancement file would be supplied on a floppy disk, downloaded to the computer 4, and then uploaded by the computer 4 to an electrically erasable firmware memory 36 in the camera 1 via the same interface cable 38. This additional embodiment of the invention is further shown in FIG. 10 in relation to an interface section 34 through which images are transferred to the computer 4 and operating software is uploaded from the computer to the electrically erasable firmware memory 36 in the camera. FIG. 11 generally shows the connection of the camera of FIG. 10 to a computer 4 by means of a standard electrical computer interface cable 38. In addition, many modifications may be made to adapt a particular situation without departing from the essential teachings of the present invention. It is accordingly intended that the claims shall cover all such modifications and applications as do not depart from the true spirit and scope of the invention.
